UI and UX design critique

DigiConsent agentic onboarding, cards-copy prototype

Subject: agentic-setup-final-approach-cards-copy.html, desktop, 1440 by 900

Date: 14 October 2026

Status: for design review

This document is AI-assisted and covers design only: layout, hierarchy, type, colour, components, states and consistency. Copy, logic, bugs and legal content are out of scope. All suggestions are options for the design team to decide. Priority and effort ratings are estimates.

Summary

What works well

- The summary screens share one structure: a "Summary" chip, title, sub and three accordions on the left, with the content on the right. The same structure holds for Team, Brands and LOBs, GTM partners and Templates.
- The button hierarchy is clear. One blue primary (Accept or Send invites), a quiet secondary (Skip for now, Do it later) and a text link (Review) are used the same way on each summary.
- Loaders explain what is happening: a one-line caption, a segmented progress bar and a scene that matches the step. Each loader settles into its summary between about 9 and 16 seconds.
- Step names agree across the rail tooltips, setup plan and summaries (Business profile, Team, Brands and LOBs, GTM partners, Templates).
- The soft glass cards and the violet, amber, red and green status colours are applied consistently in the captured states.

What most needs attention (suggested order)

- S-16 Keyboard focus goes through controls that are not visible (47 of 70 stops on one summary).
- S-10 Pending steps in the left rail are faint (about 2.3 to 1) and unlabelled.
- S-01 The type system is loose: 22 sizes, 13 weights, 5 families.
- S-04 End-state screens leave about two thirds of the screen empty and do not match the centred success screens.
- S-02 and S-03 Supporting text is small and some status text misses 4.5 to 1.

What was and was not captured

51 states were captured at 1440 by 900 with time series (4, 9, 16, 24 and 36 seconds for loaders and the setup plan; 3 to 10 seconds for summaries and success screens) and a final frame. They cover the agreements gate (both tabs), the setup plan, five loaders, four summaries (collapsed and expanded), four details pages, six success states and 25 scenarios. 1789 text elements were measured. Not captured: hover and focus screenshots for most controls (one keyboard-order pass was run on the Brands summary), the business-profile verification overlay, the business-profile approved bar, and any viewport other than 1440 by 900. See the last section.

The list

Every suggestion with a suggested priority and effort (the reviewer's estimates). The Decision column is left empty for the design team.

ID	Suggestion	Priority	Effort	Decision
S-01	Type scale has 22 sizes, 13 weights and 5 font families	High	Medium	
S-02	Most supporting text sits at the 12 px floor	Medium	Medium	
S-03	Status text falls below 4.5 to 1 contrast	Medium	Low	
S-04	Status screens place content in the top third and leave about two thirds empty	High	Low	
S-05	The primary action on summaries sits far from the content it confirms	Medium	Low	
S-06	Template count labels were truncated in the captured build	Medium	Low	
S-07	GTM partner cards carry a lot of data per card	Medium	Medium	
S-08	The lowest rate is shown by colour alone	Medium	Low	
S-09	Accordions look like plain text and hide the consequence of Accept	Medium	Low	
S-10	Pending steps in the left rail are faint and have no labels	Medium	Low	
S-11	The skip-intro control is an unlabelled double chevron	Low	Low	
S-12	Team cards repeat the role twice	Low	Low	
S-13	Brand cards repeat one line under every line of business	Low	Low	
S-14	GTM details page: clipped headline and avatars meeting the countdown pill	Medium	Low	
S-15	Setup plan: icons and step rows drift out of alignment	Medium	Low	
S-16	Keyboard focus passes through controls that are not visible	High	Medium	
S-17	Success card states the same facts twice	Low	Low	

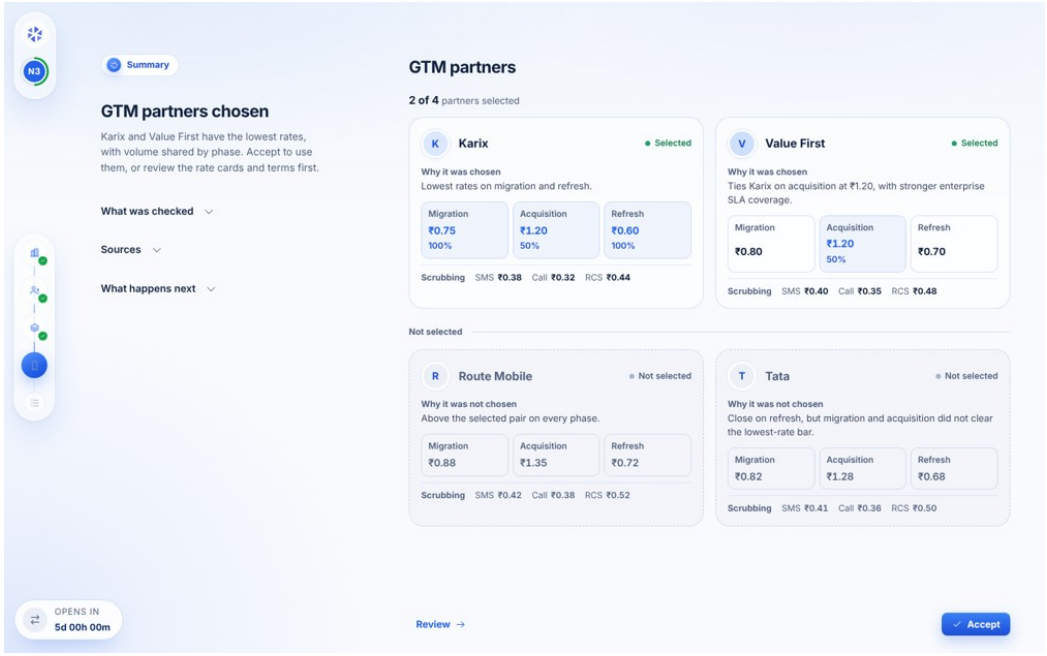

Suggestions in detail

Priority and effort are estimates by the reviewer. Each suggestion is one option for the designer to decide.

S-01 Type scale has 22 sizes, 13 weights and 5 font families

Suggested priority: High. **Effort:** Medium.

Observed. Across the 51 captured states, 22 distinct font sizes are in use, from 12 px to 40 px, with many half-pixel steps (12, 12.5, 13, 13.5, 14, 14.5, 15, 15.5, 16, 16.5, 17). A single screen uses up to 11 sizes (Templates summary). 13 distinct font weights appear (400 to 700, including 550, 560, 580, 620, 630, 640, 660, 680). Five font families appear: Geist, Inter, Geist Mono, JetBrains Mono and ui-monospace. The tables in the appendix list every value and its element count.

Summary screen for GTM partners. Measured on this screen: 9 distinct sizes. The full counts are in the appendix tables.

Principle or standard. Gestalt similarity (things that look alike read as alike); type-scale and token practice in Material 3, Carbon and Primer, which use a small fixed set of steps (roughly 8 to 10) and 3 or 4 weights. Nielsen heuristic 4 (consistency and standards).

Suggested direction (one option). Option: define one type scale of about 8 steps (for example 12, 14, 16, 20, 24, 32, 40) and 3 weights (400, 500 or 600, 700), map the existing values to the nearest step, and keep one sans and one mono family.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-02 Most supporting text sits at the 12 px floor

Suggested priority: Medium. **Effort:** Medium.

Observed. Of 1789 text elements measured across all states, 689 (39%) are 12 px and 1,351 (76%) are 13.5 px or smaller. Labels, chips, scrubbing rates, reasons, accordion content and status text all share this range. The file also runs a script (opA11yPass) that raises any text under 12 px to 12 px at runtime, so the stylesheet itself may contain smaller values.

Template cards: counts, labels and captions are 12 to 13 px.

Principle or standard. Hierarchy and readability (Refactoring UI: size and weight carry hierarchy; too many items at one small size flatten it). Material 3 and Carbon keep 12 px for captions and helper text and use 14 px for body.

Suggested direction (one option). Option: lift body-level supporting text (reasons, descriptions, scrubbing row) to 14 px and keep 12 px for true captions only. Check that cards still fit.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-03 Status text falls below 4.5 to 1 contrast

Suggested priority: Medium. **Effort:** Low.

Observed. Amber status text "2 of 3 approved", "2 of 4 approved" and "Needs attention" (12.5 px) measures 4.02 to 1. Green "Approved" and "Active" (12 px) measure 4.31 to 1. Both are below the 4.5 to 1 needed for text under 18 px. White labels on the blue buttons were flagged by the script (1.05 to 1) but are false positives from the gradient background and read correctly by eye. Contrast over gradients uses the nearest solid background and is approximate.

Status text beside the eyebrow chip on the "Not approved yet" screen, enlarged 2.5 times.

Principle or standard. WCAG 2.2 success criterion 1.4.3 (contrast minimum, 4.5 to 1 for normal text).

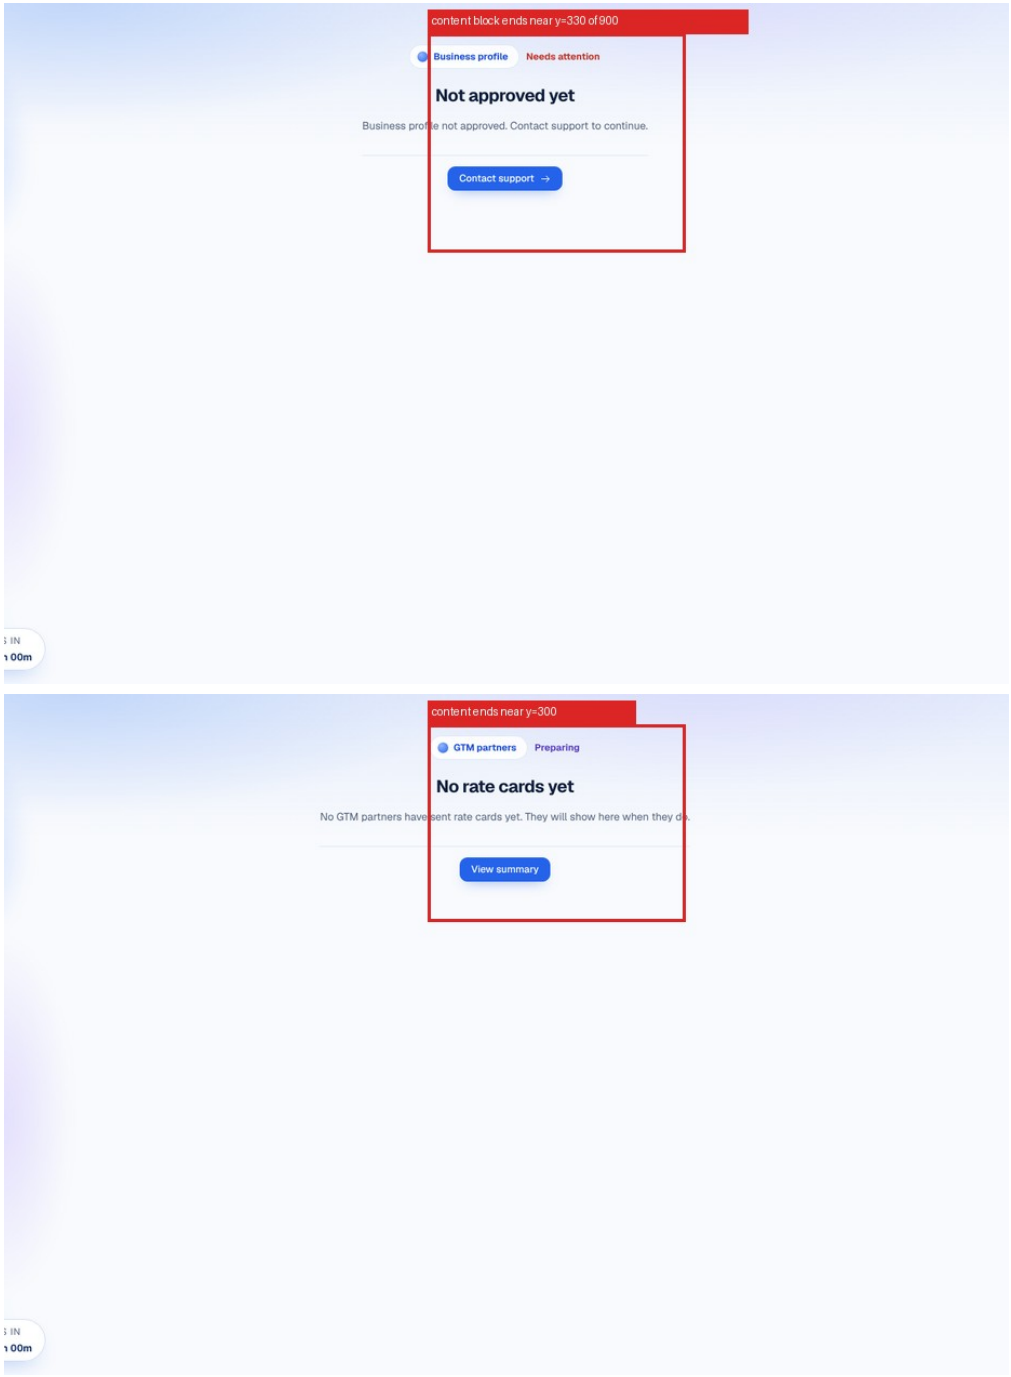

Suggested direction (one option). Option: darken the amber to about #92400E and the green to about #166534 for text, and keep the lighter tones for dots and fills.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-04 Status screens place content in the top third and leave about two thirds empty

Suggested priority: High. **Effort:** Low.

Observed. On the in-review, partly approved, none approved, no rate cards and templates attention screens, the content block (chips, title, sub, button) ends near y = 330 px of 900 px at 1440 by 900. The kick-off and success screens centre their content vertically. The remaining screen below the button is empty.

Two status screens at 1440 by 900. The red box marks where the content ends.

Principle or standard. Gestalt figure and ground and balanced composition; Nielsen heuristic 4 (consistency), because other end states are centred.

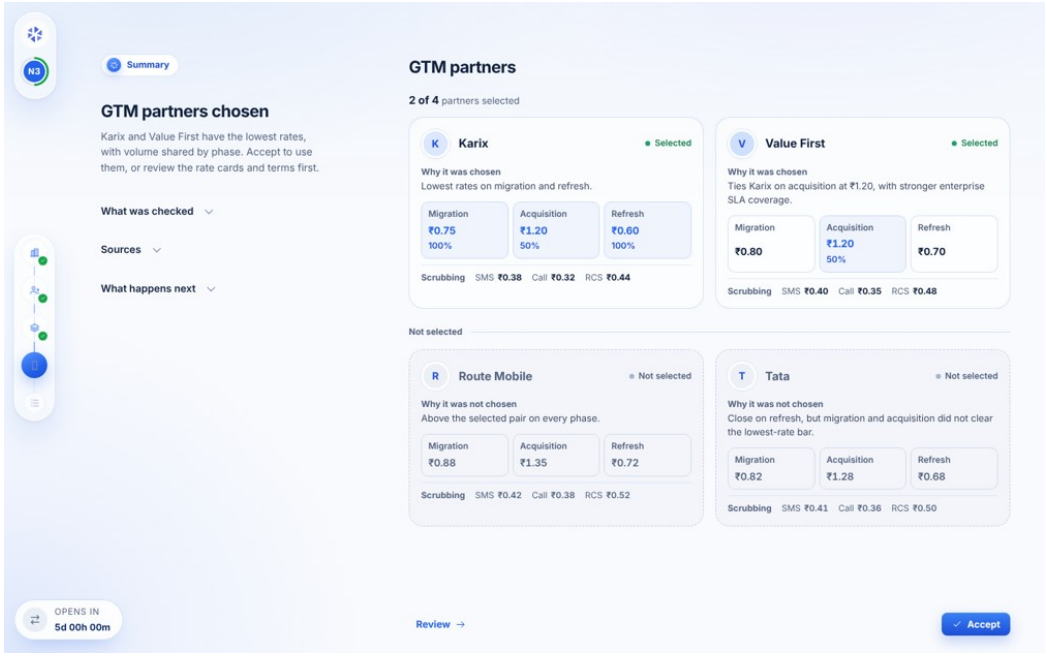

Suggested direction (one option). Option: centre the block vertically as on the success screens, or anchor it at a fixed optical centre (about 40% from the top) on all end states.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-05 The primary action on summaries sits far from the content it confirms

Suggested priority: Medium. **Effort:** Low.

Observed. On summary screens, Accept sits in the bottom-right corner and the Review link in the bottom-left of the content column, while the title, sub and cards are at the top. The distance from the summary title to Accept is about 600 px at 1440 by 900. The countdown pill sits in the same band at the left.

GTM partners summary at 1440 by 900.

Principle or standard. Fitts's law (time to reach a target grows with distance and falls with size); Gestalt proximity (an action near the thing it acts on reads as related).

Suggested direction (one option). Option: keep the action bar but dock it directly under the card grid when the grid is short, and fix it to the bottom only when the grid scrolls.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-06 Template count labels were truncated in the captured build

Suggested priority: Medium. **Effort:** Low.

Observed. In the captured build, the three counts on each template card read "SUGGESTED", "HIGH CONFIDENC" (cut off) and "NEED REVIEW". The tiles were about 95 px wide and the labels are uppercase 12 px. This was fixed during the review session after the captures (icons added, labels allowed to wrap). The evidence image shows the state at capture.

Template cards at capture time: the middle label is clipped.

Principle or standard. Nielsen heuristic 1 (visibility of system status) and 8 (aesthetic and minimalist design): clipped labels read as errors.

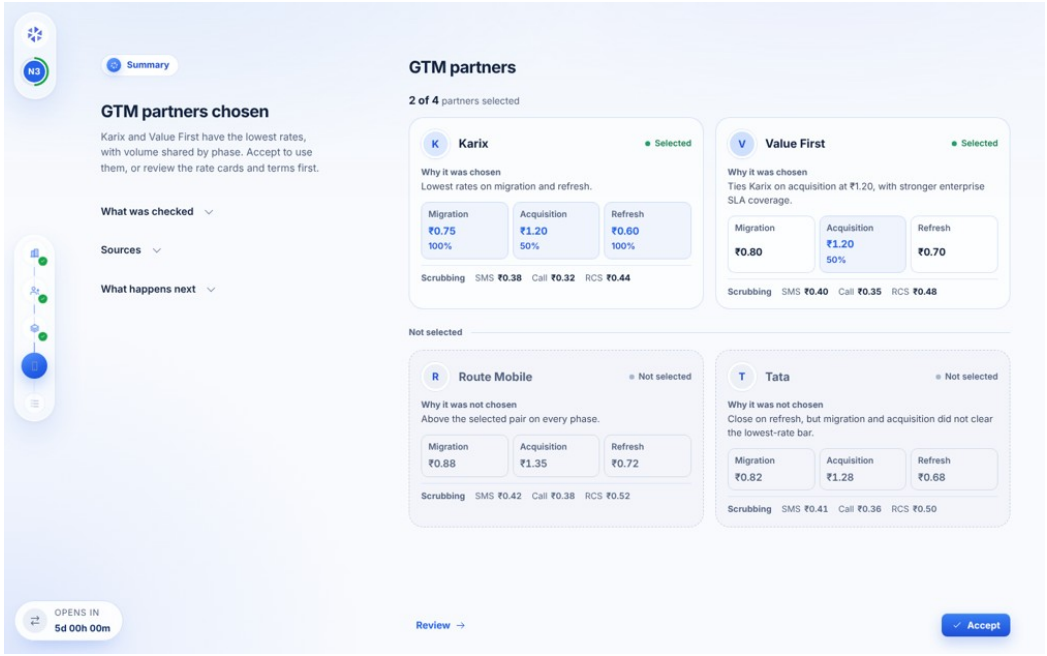

Suggested direction (one option). Status: already adapted in the file (icon above, label wraps). Option: confirm the wrapped labels at narrower widths.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-07 GTM partner cards carry a lot of data per card

Suggested priority: Medium. **Effort:** Medium.

Observed. Each of the 4 cards shows a name, a status, a reason, three phase tiles (rate, plus share for selected partners) and a scrubbing row with three rates. That is up to 14 data points per card and about 50 on the screen. Comparing one phase across partners means reading across two rows of two cards.

GTM partners summary, selected partners first, then not selected.

Principle or standard. Hick's law (more items, slower decisions); Gestalt proximity and common region (data to be compared should align); Refactoring UI (reduce what competes for attention).

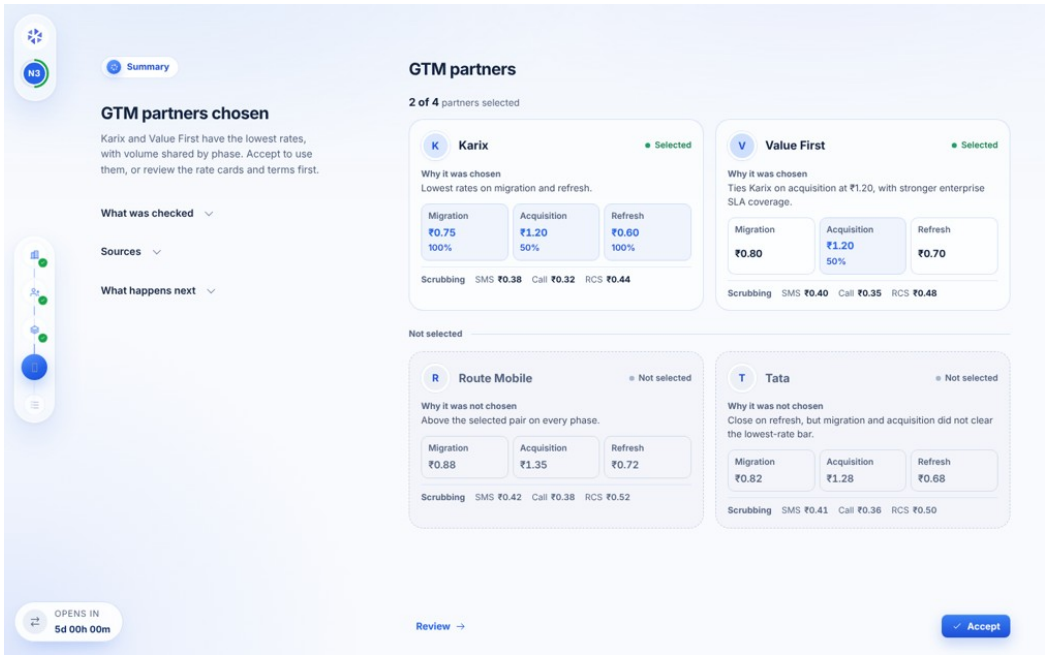

Suggested direction (one option). Option: one column per phase aligned across partner rows so a phase can be scanned vertically, with the reason as the only sentence per partner. Cards can stay for the selected pair.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-08 The lowest rate is shown by colour alone

Suggested priority: Medium. **Effort:** Low.

Observed. On GTM cards the lowest rate in each phase is blue and bold inside a tinted tile. The explanatory note that said "Blue is the lowest rate" is no longer on the screen. Viewers who cannot tell the blue from the dark text, or who print the page, get no other signal.

GTM cards. The lowest rates are blue.

Principle or standard. WCAG 2.2 success criterion 1.4.1 (use of colour): colour must not be the only way to convey information.

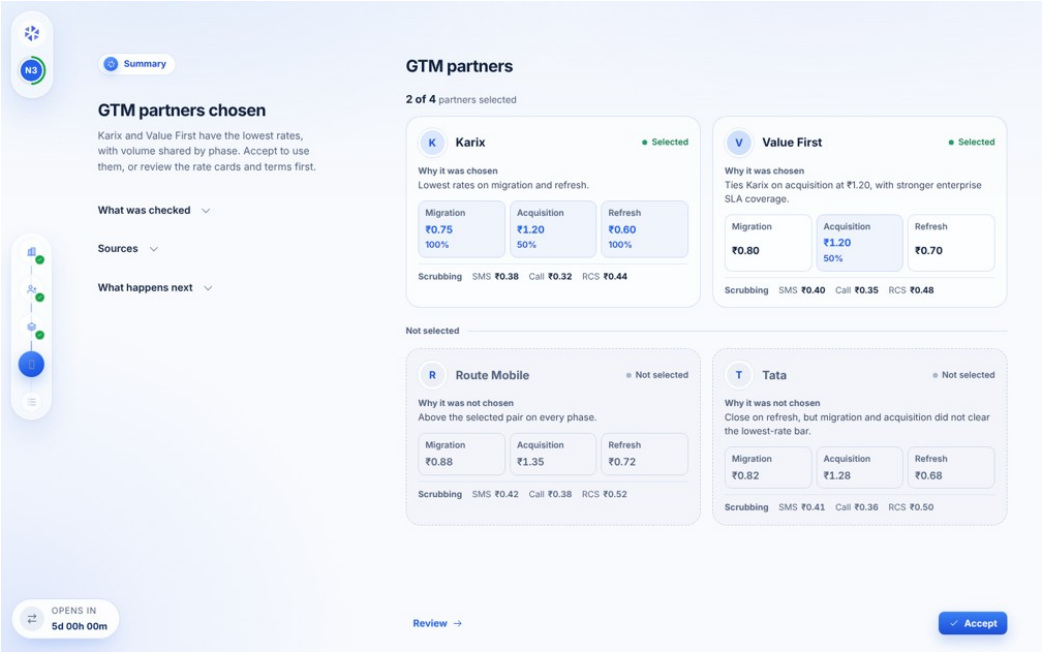

Suggested direction (one option). Option: add a small "Lowest" tag or a check icon next to the lowest rate, and keep the blue as reinforcement.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-09 Accordions look like plain text and hide the consequence of Accept

Suggested priority: Medium. **Effort:** Low.

Observed. The left column holds three collapsed rows: What was checked, Sources and What happens next. They have a 12 px grey chevron and no border or fill until hover. "What happens next" describes what Accept does, and it is collapsed by default.

The three rows sit under the summary sub.

Principle or standard. Norman on signifiers (a control should show that it can be operated); Nielsen heuristic 5 (error prevention) and 1 (visibility of system status).

Suggested direction (one option). Option: open "What happens next" by default, and give all three rows a hairline divider and a visible chevron so they read as controls.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-10 Pending steps in the left rail are faint and have no labels

Suggested priority: Medium. **Effort:** Low.

Observed. Upcoming step icons are 14 px, colour #7D8FB3, shown at 0.75 opacity inside a 32 px button. Against the button fill this gives about 2.3 to 1 (the icon colour alone is 3.2 to 1). The rail is icon-only: step names appear only as a tooltip.

The rail enlarged 2.5 times. The two lower icons are the pending steps, at about 2.3 to 1.

Principle or standard. WCAG 2.2 success criterion 1.4.11 (non-text contrast, 3 to 1); Nielsen heuristic 6 (recognition rather than recall).

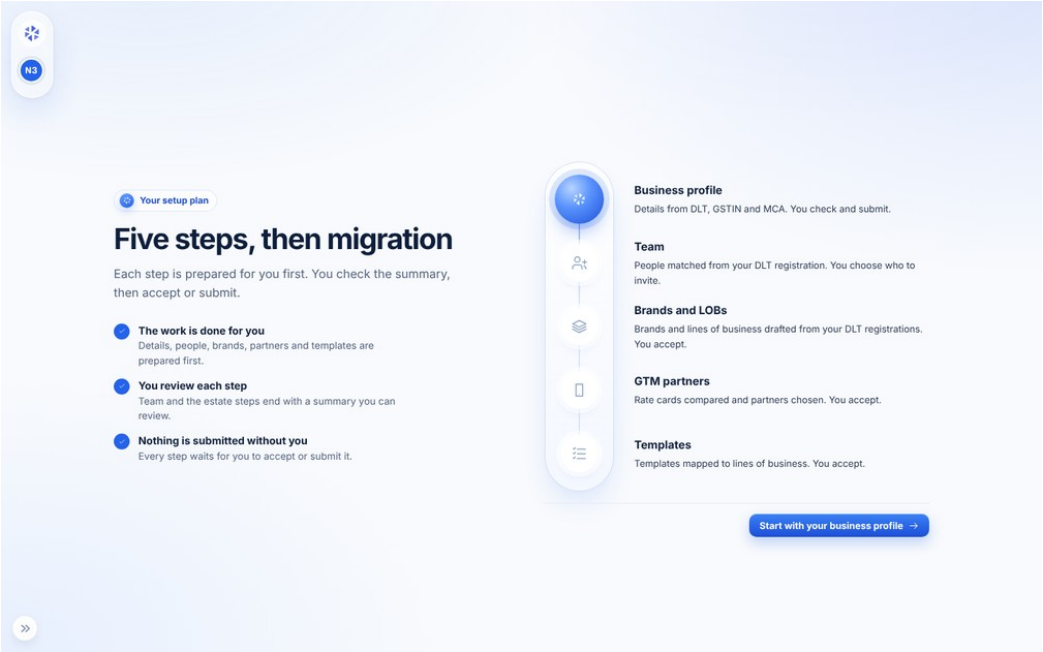

Suggested direction (one option). Option: raise pending icons to at least 3 to 1 with some margin (for example #64748B at full opacity, 4.8 to 1 on white), and show step names on hover and focus, or in a pinned wide state.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-11 The skip-intro control is an unlabelled double chevron

Suggested priority: Low. **Effort:** Low.

Observed. A 33 px round button with a "»" icon sits bottom-left on the agreements and setup plan screens. It has no visible label.

Setup plan screen. The control is at the bottom-left.

Principle or standard. Nielsen heuristic 6 (recognition rather than recall); Norman on signifiers.

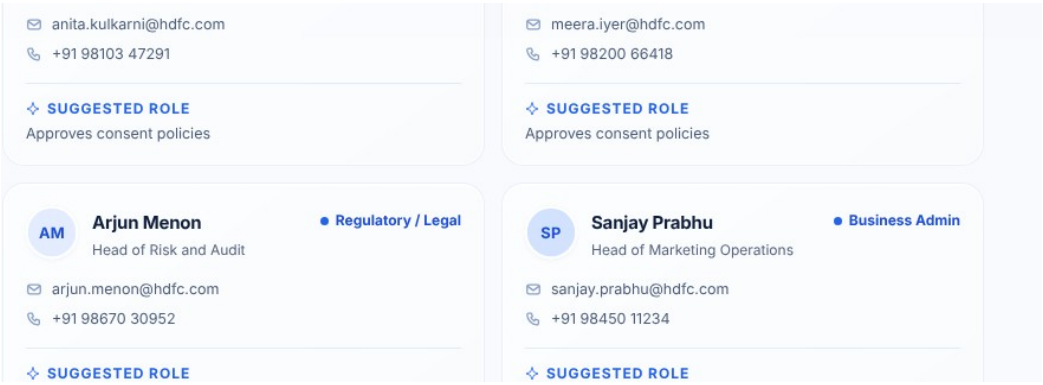

Suggested direction (one option). Option: add a label on hover and focus (for example "Skip intro"), or show the label next to the icon on first view.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-12 Team cards repeat the role twice

Suggested priority: Low. **Effort:** Low.

Observed. Each team card shows the role as a pill at the top right and again under a "Suggested role" label with a one-line description. The same role name appears twice per card, 12 times on the screen.

Team cards.

Principle or standard. Gestalt similarity and Refactoring UI (remove repeated elements that add no information).

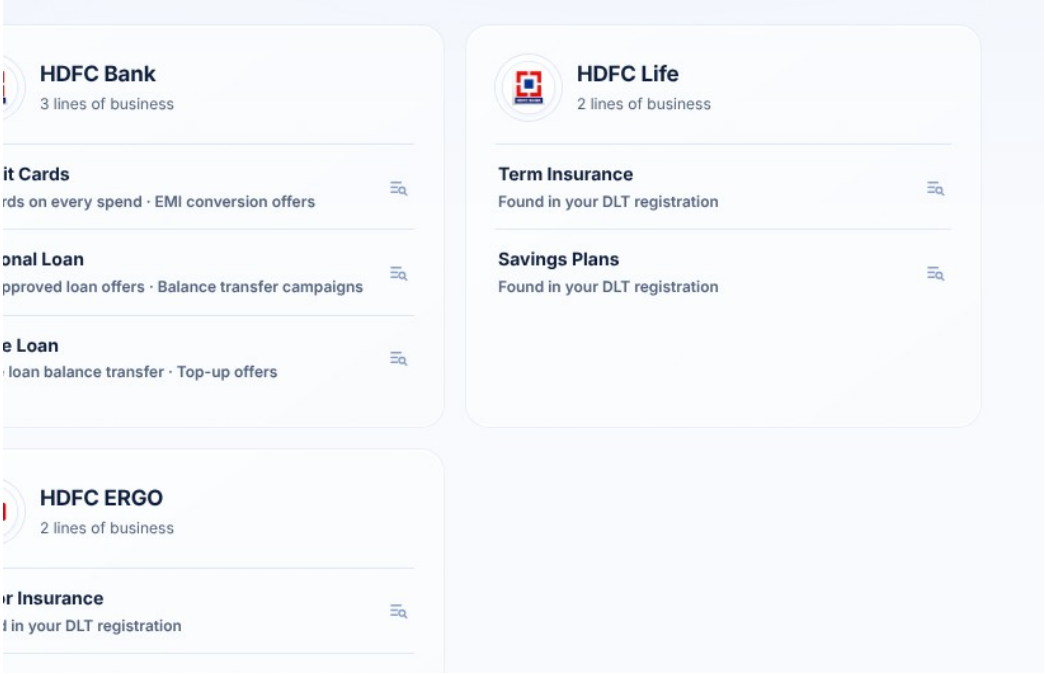

Suggested direction (one option). Option: keep the pill and show only the description under it, without the repeated label.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-13 Brand cards repeat one line under every line of business

Suggested priority: Low. **Effort:** Low.

Observed. Under HDFC Life and HDFC ERGO every line of business carries the same second line, "Found in your DLT registration". It appears 4 times on one screen and has the same weight as the line above it.

Brands and LOBs summary: the same second line repeats under each line of business.

Principle or standard. Refactoring UI (do not repeat what can be said once); Gestalt common region (a shared source can be stated once on the card).

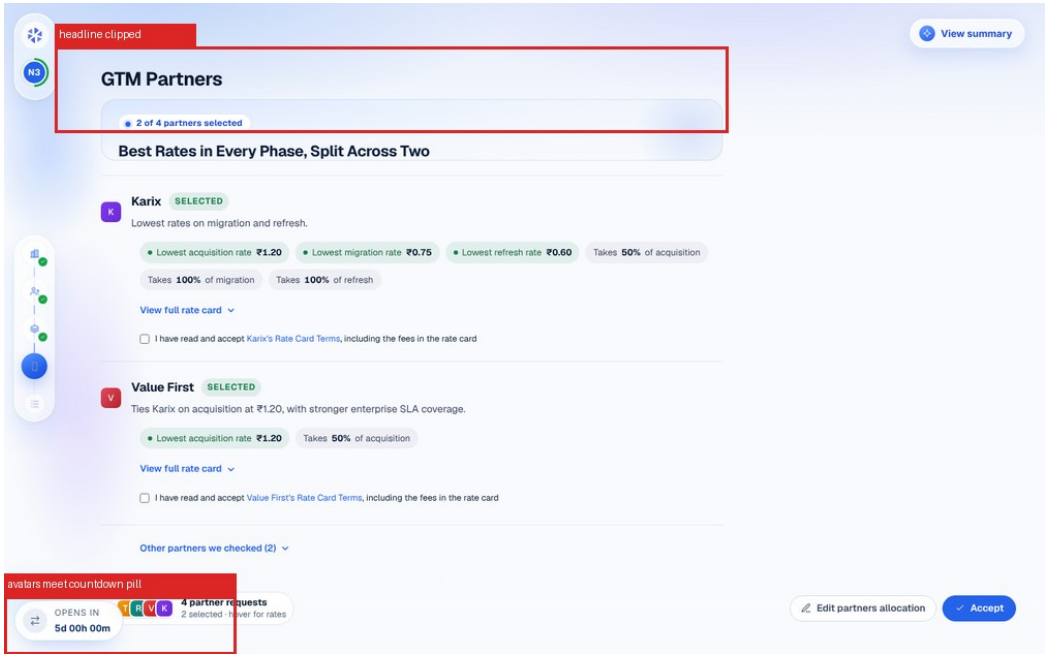

Suggested direction (one option). Option: state the source once in the card header and keep per-line details only where they differ.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-14 GTM details page: clipped headline and avatars meeting the countdown pill

Suggested priority: Medium. **Effort:** Low.

Observed. The headline "Best Rates in Every Phase, Split Across Two…" is cut off inside a banner, and the avatar stack of the "4 partner requests" footer sits against the countdown pill at the bottom-left.

GTM details at 1440 by 900. The red boxes mark the clipped headline and the collision.

Principle or standard. Nielsen heuristic 8 (aesthetic and minimalist design); Gestalt proximity (unrelated items touching read as related).

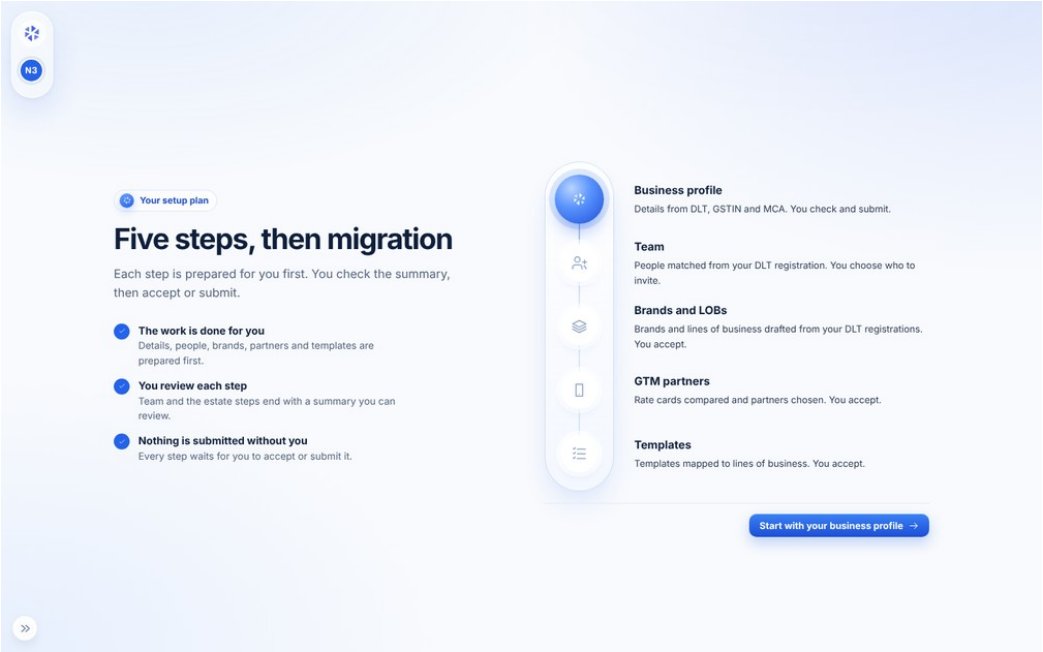

Suggested direction (one option). Option: let the banner grow with its text, and give the footer a left offset so it clears the pill.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-15 Setup plan: icons and step rows drift out of alignment

Suggested priority: Medium. **Effort:** Low.

Observed. On the setup plan, the five icons in the capsule are on an 88 px grid (y = 273, 361, 449, 537, 625). The step titles beside them sit at y = 261, 339, 427, 525, 613, so the offsets are 12, 22, 22, 12 and 12 px, and the rows have different heights. The primary button sits under the list at the far right, away from the left column that holds the three points.

Setup plan at 1440 by 900.

Principle or standard. Gestalt continuity and proximity (items that belong together should align); Fitts's law for the button position.

Suggested direction (one option). Option: use a fixed row height for the five steps so each title centres on its icon, and place the button under the left column or centre it under both.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-16 Keyboard focus passes through controls that are not visible

Suggested priority: High. **Effort:** Medium.

Observed. On the Brands and LOBs summary, pressing Tab 70 times lands on 47 stops that are not visible (+ Add brand, Edit HDFC Bank, Delete HDFC Bank, Promo Examples and so on). Focus leaves the visible rail and reaches the visible Accept only after about 35 stops (the first Accept found is hidden). Details are in data/focus_order_summary_e0.json. This is likely caused by every screen being kept in the page at once.

No screenshot: the stops are not visible, which is the finding. See data/focus_order_summary_e0.json.

Principle or standard. WCAG 2.2 success criteria 2.4.7 (focus visible) and 2.4.3 (focus order); Nielsen heuristic 7 (flexibility and efficiency).

Suggested direction (one option). Option: mark inactive screens inert or remove them from the tab order, and keep the focus ring (2 px blue) that already exists on visible controls.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

S-17 Success card states the same facts twice

Suggested priority: Low. **Effort:** Low.

Observed. The success card shows "Accepted by Ravi Menon · 14 October 2026, 11:00 am" under the title and then repeats the same facts in a four-row table (Step, Accepted by, When, Record). The ring text around the check mark ("SIGNED · APPROVED · RECORDED") is about 8 px.

Success card after accepting GTM partners.

Principle or standard. Gestalt similarity and Refactoring UI (repetition without new information); peak-end rule (the end of the step should be quick to read).

Suggested direction (one option). Option: keep the sub line and the Record row only, or drop the sub line and keep the table.

Decision: ☐ **Adopt** ☐ **Adapt** ☐ **Decline** ☐ **Defer**

Inconsistencies

Where the prototype disagrees with itself, the requirements or the copy document. These are questions for the designer, not rulings.

ID	Topic	What differs	Principle at stake	Question for the designer
I-01	Agent bar	The copy document defines a bar line for every step. In every captured state the bar container is display:none (width 0, height 0).	Nielsen heuristic 1 (visibility of status); consistency with the requirements.	Is the bar intentionally removed, or should it show on summaries and success screens?
I-02	Success glyph	Three treatments: a pale green outlined check (brands success), a blue filled disc with a ring stamp (team, GTM, templates success), and a larger blue disc (kick-off).	Gestalt similarity; Nielsen heuristic 4.	Should one success mark be used for all steps, with the stamp reserved for signed documents?
I-03	CTA position	Success pair: Add more and Continue at the bottom-right. Kick-off and status screens: centred under the content. Summaries: bottom-right bar.	Fitts's law; Nielsen heuristic 4.	Is there one rule for where the primary action sits on end states?
I-04	Status component	Status appears as coloured text next to a chip (status screens), as a pill with a dot (list rows) and as a dot with text ("Selected" on cards).	Gestalt similarity; Nielsen heuristic 4.	Which form is the status component, and where may the others be used?
I-05	End-state layout	Profile, brands, templates and GTM status screens use a centred single column. Team empty and Team left for later use a split layout with the title on the left and a "Team" heading on the right with a lone button.	Gestalt similarity; Nielsen heuristic 4.	Should Team use the centred layout like the other end states?
I-06	Interstitial colour	"Your organisation has finished setting up" is a full-screen dark navy page. Every other screen is light.	Gestalt similarity; peak-end rule.	Is the dark screen a deliberate exception?
I-07	Summary and details	The GTM summary uses cards. The GTM details page still uses the earlier list with green tags and long chips, so the two views of one step look unrelated.	Nielsen heuristic 4; Gestalt similarity.	Should the details page follow the summary card style?
I-08	Card header pattern	Team cards put the role pill at the top right, Templates put an amber "need review" tag, GTM puts "Selected", Brands put nothing.	Gestalt similarity; Nielsen heuristic 4.	Is a top-right tag meant to be the same slot on every card, and what does it carry?

Visual system reference (one option)

The system is loose in type (S-01), so one illustrated option is given. It is a starting point, not a prescription.

Type scale (one option)

Role	Size	Weight	Used for
Caption	12	500	Chips, helper text, table labels
Body small	14	400	Descriptions, reasons, scrubbing rates
Body	16	400	Primary reading text
Label strong	14	600	Buttons, row titles
Title small	20	600	Card names, section headings
Title	24	600	Summary and screen titles
Display	32	700	Success and end-state titles

Status colours with text contrast on white (one option)

Status	Dot or fill	Text colour	Contrast of text on white
In review, paused	#7C3AED	#5B21B6	9.0 to 1
Needs attention	#F59E0B	#92400E	7.1 to 1
Not approved	#DC2626	#B91C1C	6.5 to 1
Approved, active	#22A06B	#166534	7.1 to 1
Working now	#2563EB	#1D4ED8	6.7 to 1

Contrast values are computed with the WCAG relative luminance formula against white. Check them again over the real card backgrounds before adopting.

Spacing scale (one option)

4, 8, 12, 16, 24, 32, 48 px. Card padding 16 or 24. Gap between cards 16. Gap between sections 32.

Decision log

Record each decision with the date. If a suggestion is adapted, note what is wanted or write "details to be added".

ID	Suggestion	Decision	Date	Notes
S-01	Type scale has 22 sizes, 13 weights and 5 font families			
S-02	Most supporting text sits at the 12 px floor			
S-03	Status text falls below 4.5 to 1 contrast			
S-04	Status screens place content in the top third and leave about two thirds empty			
S-05	The primary action on summaries sits far from the content it confirms			
S-06	Template count labels were truncated in the captured build			
S-07	GTM partner cards carry a lot of data per card

I-08	Card header pattern			

Method and limits

How it was captured

- Chrome driven by Playwright at 1440 by 900. Motion left on. The script is capture.js in this folder.
- Each state was loaded fresh. Loaders and the setup plan were captured at 4, 9, 16, 24 and 36 seconds. Summaries, success and details screens were captured at 3 to 10 seconds, then a final frame.
- Summaries were also captured with the accordions expanded. Success screens were reached by clicking the primary or skip action on each summary. All 25 scenario buttons were clicked and captured.
- The prototype keeps several screens in the page at once, so visibility was checked with elementFromPoint before any text, size, contrast or target was counted. The loader "final" frames show the summary because each loader settles into it; the loader itself is in the 4, 9 and 16 second frames.

Measurements

- Type: computed font size, weight and family for every visible text element. Contrast: WCAG relative luminance of the text colour composited on the nearest opaque background. Where an ancestor has a gradient, the value is approximate and flagged. Targets: bounding box of every visible button, link, input and tabbable element, flagged under 24 by 24 px. Inline links in sentences are exempt from WCAG 2.5.8, so they were not raised as findings.
- Contrast of 1.0 to 1.05 on white-on-blue buttons and on coloured avatar letters is a false reading from gradient backgrounds and was discarded.
- The file runs a script that raises text under 12 px to 12 px and darkens some grey text. Measured sizes and contrasts therefore describe the screen as a user sees it, not the raw stylesheet.

Not reached or approximate

- Hover and focus screenshots: one keyboard-order pass was run on the Brands summary and one hover on Accept. Other controls were not captured in those states.
- The business-profile verification overlay and the approved bar were not reached in a clean capture.
- Only 1440 by 900 was tested. Narrower desktop widths, where some labels already wrap, were not captured.
- Return open and return unchanged show the same screen in the captures, so the difference between them could not be seen.
- Prototype data (partner names, rates, counts, the countdown) is illustrative and was not critiqued.
- The Templates mapping list, the business profile form, the agreement text, the rate-card table and the migration page come from approved designs or existing screens and were not critiqued.

Standards used

WCAG 2.2: 1.4.1 use of colour, 1.4.3 contrast minimum, 1.4.11 non-text contrast, 2.4.3 focus order, 2.4.7 focus visible, 2.5.8 target size (minimum). Nielsen's ten usability heuristics. Gestalt principles. Fitts's law and Hick's law. Type-scale practice from Material 3, Carbon and Primer. Refactoring UI. Norman on affordances and signifiers. Peak-end rule.

Noted, not critiqued

- Copy: the loader caption "Marking how confident each suggestion is" reads as cut off. The log-out dialog title is in Title Case.
- Logic: the success screens move on after a short countdown; the Return open and Return unchanged scenarios cannot be told apart.

Appendix: measured values

Font size	Elements
12 px	689
12.5 px	351
